

[ABSTRACT]

The present invention provides a mobile phone system, which can give a desired voice message to a user of an opposite party terminal without speaking in a state that limitation to usable voice messages has been reduced, while allowing a user existing under an environment that he/she can not speak to listen to a voice from the opposite party terminal. A mobile phone terminal 1 is provided with means 12 for transmitting a connection request of a packet switching line to the side of a network and means 11 for transmitting data corresponding to a desired voice message, while the network is provided with data/voice message converting means 4 for converting transmitted data to a voice message corresponding thereto and means for merging the converted voice message to a circuit switching line of the opposite party terminal to transmit the same.
